# Before the data: a sample of each report

Before asking for real data, we would like to see **how your system exports its reports**. That way the LUUMA tool reads them correctly from day one, and the pilot is not held up by a format.

This step involves **no patient data at all**: only the shape of each report, filled with invented data.

## How it works

1. **A sample of each report**
   Real headers and five invented rows. LUUMA tunes the tool to your system.
   THIS DOCUMENT
2. **Access to the app**
   LUUMA shares the app link. It opens in the browser, nothing to install.
3. **Loading the reports**
   You export the real reports and drop them into the app, on the clinic's computer.
4. **Review**
   The app shows what it recognised and what is missing. You confirm or fix it right there.
5. **Delivery**
   You download the Excel file with aggregated counts and send it to LUUMA. The clinic keeps its own report.

## Step 1 · What to send for each report

1. The **exact column headers** your system produces: in your language, with its abbreviations and in the same order.
2. **Five rows of invented data**, not real patients.
3. Invented values that **look like real ones**: the same date format, the same codes and abbreviations (for example how the system writes a negative test or a discarded embryo), and empty cells where the system leaves them empty.
4. The **same invented patient numbers across all reports**, so we can check that the reports link up.
5. One file per report, **as the system exports it** (Excel or CSV), without reformatting.

## What a sample looks like (retrievals report, invented data)

| Patient no. | Retrieval date | Type | Physician | Age | Oocytes | Status |
|---|---|---|---|---|---|---|
| 000123 | 03.02.2025 | Own | Dr A | 34 | 12 | Done |
| 000123 | 18.06.2025 | Own | Dr A | 34 | 8 | Done |
| 000457 | 11.03.2025 | Egg freezing | Dr B | 38 | | Done |
| 000981 | 02.04.2025 | Own | Dr C | 41 | 0 | Cancelled |
| 001204 | 27.05.2025 | Donor | Dr B | 44 | | Done |

Column names and values are your system's own; these are for illustration only.

## The reports

Send a sample of the ones you have; they do not need to include every column.

| | | |
|---|---|---|
| **Retrievals** | Required | Patient (the same number in every report), date and retrieval type (own, donor, egg preservation, cancelled). If available: site, physician, age or date of birth, payer, prior cycles. |
| **Transfers** | Required | Patient, date, site and the outcome (negative, loss, live birth, ongoing), not just the β-hCG; here or in its own report. If available: loss date, embryo source, transfer number. |
| **Pregnancy outcomes** | Optional | Only if the outcome is not in Transfers: patient, outcome and date (or transfer number). |
| **Donor-egg cycles** | Recommended | Patient and cycle date. |
| **Embryology by retrieval** | Recommended | Patient and retrieval date (or number); per embryo, stage, PGT-A result and fate (or the counts per retrieval). |
| **Cryopreservation** | Recommended | Patient and freeze date; if available, exit date and type. If only the current inventory is available, it still helps. |

## If a report does not exist

- Just tell us and carry on with the others. **Please do not build it by hand.**
- If the data are kept in another system (for example the lab's or the embryo bank's), please send a sample from that system too.

## It also helps to know

- The name of the system and its vendor.
- How you report to the national assisted-reproduction registry: by hand, or with a file the system generates.
- Your IT contact and your data protection officer.

## Privacy

- This step involves no patient data.
- In the pilot, the real reports are processed **on the clinic's own computer**: only aggregated counts and percentages reach LUUMA.
